

Priscah Cheruiyot

Biostatistics Fellow

“I think it’s unfair that, in this day and age of technological advancement, children still die of preventable diseases in low-resource settings.”

Priscah Cheruiyot will receive her Master’s degree in Biostatistics from the School of Public Health at the University of California, Berkeley in the spring of 2018.

In Priscah’s quest to become a Biostatistician, she is interested in applying real-world data analysis to help reduce disease burden in low-resource countries.

It is this intersection between technology and global health that led her to pursue a fellowship at PATH. She hopes that this experience will give her practical skills needed to navigate the world of global health, as well as a closer view into where technologies can be applied to solve some of today’s global health issues.
